RE: R6 2005 ROD- Aminopyralid

Dear Mr Montoya,

I am writing in support of adding aminopyralid to the approved list of herbicides for use on the Wallowa-Whitman National Forest.

As a selective herbicide, aminopyralid allows land managers to target specific noxious weeds while reducing impact to non-target species. Noxious weeds such as rush skeletonweed, sulphur cinquefoil, meadow hawkweed, and yellow starthistle are prevalent in our region. Adding aminopyralid to our available "tools in the toolbox" will help us better manage these and other noxious weeds and is a step in the right direction for better land management practices as a whole.

Thank you,

Lindsey Jones
